Guide to Kturtle - Free. Kturtle from the sourceÂ . Â .Technical Field The present disclosure generally relates to a scan driving circuit and a test apparatus having the scan driving circuit, and more particularly, to a scan driving circuit capable of not changing a scan driving state at the same time as a test is performed, and a test apparatus having the scan driving circuit. Related Art A test apparatus in a semiconductor integrated circuit needs to be able to perform a scan test. When a scan test is performed, the test apparatus performs a first test and performs a second test while the test apparatus is changing a state in which a scan pattern is applied. That is, the scan test is performed while a scan driving circuit in the test apparatus is in a state where a scan mode is in a power-on state. The scan test includes the following two types. A first type is a scan test in which a scan pattern is applied while a scan test is performed, and power supply is supplied to the entire test apparatus, for example, as disclosed in Japanese Laid-Open Patent Publication No. H6-154998. A second type is a scan test in which a scan pattern is applied while a scan test is performed, and power supply is supplied to only a scan driving circuit, for example, as disclosed in Japanese Laid-Open Patent Publication No. 2010-156991. In the first test, a scan test is performed by applying a scan pattern to a scan pattern generator (scan pattern generator) in the test apparatus, and a large amount of current is consumed. Therefore, it is preferable that power supply to the entire test apparatus can be stopped to prevent current from being consumed. However, in the second test, a scan pattern is applied to a scan pattern generator (scan pattern generator) in the test apparatus by a scan driving circuit, and a large amount of current is consumed. Therefore, it is desirable that power supply to the scan driving circuit can be stopped to prevent current from being consumed. However, in the second test
